I have purchased Let's Plays before, but this is by far the most epic YouTuber out there. Fingers crossed I can get this latest episode uploaded before the game gets released. [Outro] That is literally the nicest thing I've heard in an app game. Thats frickin priceless for a game thats supposed to be about business. After reading people's responses to this post, I thought I should post this thread. I am just a young gamer and I barely know anything about Sims. I have an account on my mom's computer that I use to play the Sims Lite game. I have just been wanting to give the Sims 4 a try. I am also new to this. Le paquet content Rules: I am playing as a mom, wife, and student. I am not sure if I will actually make these families, but I am here to enjoy the process. How I made it: I saved, quit and started over because there were too many bugs to update the family. I have a family, though I think it's bugged out. This is the family I got: A beautiful dark skin, dark skin mom, and light skin dad. I named them Daphne and Neil. Daphne has blue hair and blue eyes. I love her hair! I love the hair. I might even buy extra packs and purchase hair colors. The hair looks so real! I really like the clothes. The outfits (brown pants and white blouse) look great together. I will definitely be using them. I am not too crazy about the house. I think it looks nice, but I would prefer a granny house. I don't know what to do with all this land. I still love them. This is something that I will have to stick with over the last few updates. My questions: Does anyone else have a house like this? What was the best family update? My last family update gave me the best family update I've had! What happened? I've been trying to recreate this but I just cant. They are missing their dream home. Can you help me? Teaching them to cook was a requirement for my family to get their dream home and now, they just can't cook. How am I supposed to progress in the skill if they are saying "I cant

The high cost of milk production requires a greater use of in vitro analyses to predict the milk composition at drying-off or at finishing. The objective of this study was to investigate whether changes in milk physicochemical properties after inflammatory response could be linked to rheological properties. Milk samples were collected from the time of the parturition to dry-off, from 90 to 60 d in milk, and from 3 to 12 mo of lactation. Tissue maturity-free samples were processed after a single injection of 10 μ g of recombinant human prostaglandin F2 α (PGF2 α) into the udder after cleaning and drying. The milk yield decreased, and milk fat decreased by 35%, and milk fat-protein ratio decreased by 14% in PGF2 α -induced milk. The fat globule size was enlarged by 12% in PGF2 α -induced milk and there was an increase in the water-holding capacity of milk, particularly in the case of milk from cows in early lactation. The stability against thixotropy was poor in both milk from PGF2 α -induced cows and milk from healthy cows at the time of milking (from calving, from 78 \pm 2 to 63 \pm 5 d in milk). Conversely, the stability against thixotropy of milk from healthy cows became stronger and more similar to milk from PGF2 α -induced cows at the time of milking (from 79 \pm 4 to 59 \pm 2 d in milk). Thus, milk from PGF2 α -induced cows had lower thixotropy stability than milk from healthy cows, but the relationship was reversed at the time of milking, because the tendency to thixotropy was reversed in milk from PGF2 α -induced cows. These results suggest that increased concentrations of colostral proteins, low pH, and high concentrations of butyric and caproic acids could be responsible for this relationship. Indeed, decreased whey protein concentration, increased pH, and increased colostral butyric acid concentration were observed. It is recommended that in vitro analyses to predict milk composition at drying-off or at finishing be based on measurements taken at the time of milking or at the time of milking and drying-off.
