PhotoShow.com has thousands of free tutorials that cover both beginner and advanced topics. You can also look for some tutorials on YouTube. Fundamentals Photoshop enables you to create and alter raster images. You can manipulate the shapes, colors, and sizes of individual areas. You can apply layers to parts of the image to give it more depth and nuance. Photoshop has lots of features, and this section explains the basics of using some of the most basic techniques. Creating Layers Layers have several uses. Like windows, the layers in Photoshop act as doors, gateways, through which you can move pieces of the image, paint on them, or modify them. To create a new layer, use the Layer dialog box, shown in Figure 6-1. FIGURE 6-1: Use the Layer dialog box to create a new layer. You see the Layer dialog box when you click the Layers palette. As you can see in the figure, you can use most of the tools in the palette by using them on the active or currently selected layer. Although you can use the Edit menu to create a new layer, it's much quicker to use the Layer dialog box. Adding a new layer In the Layers palette, you see the names of existing layers and the (hidden) name of the layer used to create the image. The button next to the plus symbol and the small arrow, as shown in the figure, enables you to add a new layer. Click it and then type the name. You see the Layer dialog box, shown in Figure 6-2. As you see in the figure, you can modify the layer's name and other properties on the right side of the dialog box. If you were to choose New Layer, you would end up with two layers — one visible and one hidden, as shown in Figure 6-2. I recommend that you don't use the New Layer command at this time because you will probably want to experiment a bit to see what you like. FIGURE 6-2: You can modify layer properties in the Layer dialog box. To edit a layer, you click it in the Layers palette and then select one of its tools from the toolbox. When you edit a layer, you can see a preview of the effect in the image in the bottom-right corner of the workspace, as shown in Figure 6-3. FIGURE 6-3

Abstract We study the statistical properties of the features extracted from the distributions of the diffractive structure functions $ZF_2(Q^2)$ and $ZF_3(Q^2)$ from the COMPAS experiment at NIM and CEPS, and compare the results with those obtained at RHIC. The results are based on a global fitting analysis taking into account the statistical uncertainties of the measurements and the bin-to-bin correlations. Using an approach similar to the one described in the context of factorization breaking in inclusive DIS, we find that the valence and sea quark densities as well as the gluon density in the proton are consistent with those obtained previously in global analyses of spin asymmetries, and confirm that the mean value of the strong coupling constant is significantly smaller than in the world average. In addition, the resulting unpolarized and polarized distributions are well described by those extracted by the HERA experiment.
